## Chapter 2. Solutions to *Domain-Theoretic Foundations of Functional Programming*

### 2.1 PCF and its Operational Semantics

**Problem 1.** (Page 14) \*Problem Statement\*

**Problem 2.** (Page 16) (Lemma 2.1.) The evaluation relation  $\Downarrow$  is deterministic, i.e. whenever  $M \Downarrow V$  and  $M \Downarrow W$  then  $V \equiv W$

**Solution:** We prove this by induction on the structure of the derivation.

**Base cases.**

- By the rules of the BigStep semantics for PCF, the lemma for the following base cases is trivial:
  - $M \equiv x$ , then  $x \Downarrow x$ . So  $V$  and  $W$  can only be  $x$ ; thus,  $V \equiv W \equiv x$ .
  - $M \equiv \lambda x : \sigma. M$ , then  $\lambda x : \sigma. M \Downarrow \lambda x : \sigma. M$ .
  - $M \equiv 0$ , then  $0 \Downarrow 0$ .

**Inductive Steps.**

- If  $M \equiv \text{succ}(M)$ , then it must be derived by the rule  $\frac{M \Downarrow n}{\text{succ}(M) \Downarrow n+1}$ . Then we would have  $V \equiv n+1$  and  $W \equiv m+1$  since the successor rule is the only way to derive  $\text{succ}(M)$ . By IH, we know that  $n = m$ , thus  $n+1 = m+1$ , and hence  $V = W$ .
- If  $M \equiv M(N)$ . The derivation for  $M(N)$  must be of the form  $\frac{M \Downarrow \lambda x : \sigma. E \quad E[N/x] \Downarrow V}{M(N) \Downarrow V}$ . A second derivation for  $M(N)$  must use the same rule. i.e.,  $\frac{M \Downarrow \lambda x : \sigma'. E' \quad E'[N/x] \Downarrow W}{M(N) \Downarrow W}$ . But then by IH, we would have  $\lambda x : \sigma. E \equiv \lambda x : \sigma'. E'$ . So  $\sigma \equiv \sigma'$  and  $E = E'$ . Now, we have  $E[N/x] \Downarrow V$  and  $E[N/x] \Downarrow W$ . By the IH on the sub-derivation for  $E[N/x]$ , we conclude  $V \equiv W$ .
- If  $M \equiv \text{pred}(M)$ , then the rules are  $\frac{M \Downarrow 0}{\text{pred}(M) \Downarrow 0}$  and  $\frac{M \Downarrow n+1}{\text{pred}(M) \Downarrow n}$ . For the derivation  $\text{pred}(M) \Downarrow V$ , we must have a sub-derivation for  $M \Downarrow \underline{x}$  for some numeral  $\underline{x}$ . Similarly, for  $\text{pred}(M) \Downarrow W$ , we must have a sub-derivation for  $M \Downarrow \underline{y}$  for some numeral  $\underline{y}$ . By the IH on the sub-derivation for  $M$ , we can conclude that  $\underline{x} \equiv \underline{y} \equiv k$ .

Let's examine  $k$ . If  $k \equiv 0$ , then both derivations must be  $\frac{M \Downarrow 0}{\text{pred}(M) \Downarrow 0}$ . Thus,  $V \equiv W \equiv 0$ . Same argument is valid for the case  $k \equiv n+1$ .

- The other cases ( $Y_\sigma$ , and both cases of  $\text{if}z$ ) can be proved likewise.
